How Secure Is Your Code?

Can you share it freely?

What are the implications if someone views your source?

How hard is it to test your code?

Remember that there is no difference between running code interactively or in a script

If I can't freely view your code you are doing it wrong.*

Separate Data from Code

Values and data necessary to run your function or module should not be part of your code.

Code is free ...

... protect your data sources

Create controller scripts to pull things together

What about creating an exe version?

No

...seriously, no.
